

The Human Side of Enterprise

Douglas M. McGregor

Douglas M. McGregor was born in 1906. He was graduated A.B. from City College of Detroit (later Wayne University) in 1932 and was graduated A.M. from Oberlin College in 1933. He earned a Ph.D. from Harvard University in 1935. He is best known for his book, The Human Side of Enterprise, published in 1960. McGregor died in 1964.

It has become trite to say that industry has the fundamental know-how to utilize physical science and technology for the material benefit of mankind, and that we must now learn how to utilize the social sciences to make our human organizations truly effective.

To a degree, the social sciences today are in a position like that of the physical sciences with respect to atomic energy in the thirties. We know that past conceptions of the nature of man are inadequate and, in many ways, incorrect. We are becoming quite certain that, under proper conditions, unimagined resources of creative human energy could become available within the organizational setting.

We cannot tell industrial management how to apply this new knowledge in simple, economic ways. We know it will require years of exploration, much costly development research, and a substantial amount of creative imagination on the part of management to discover how to apply this growing knowledge to the organization of human effort in industry.

MANAGEMENT'S TASK: THE CONVENTIONAL VIEW

The conventional conception of management's task in harnessing human energy to organizational requirements can be stated broadly in terms of three propositions. In or-

der to avoid the complications introduced by a label, let us call this set of propositions "Theory X":

1. Management is responsible for organizing the elements of productive enterprise—money, materials, equipment, people—in the interest of economic ends.
2. With respect to people, this is a process of directing their efforts, motivating them, controlling their actions, modifying their behavior to fit the needs of the organization.
3. Without this active intervention by management, people would be passive—even resistant—to organizational needs. They must therefore be persuaded, rewarded, punished, controlled—their activities must be directed. This is management's task. We often sum it up by saying that management consists of getting things done through other people.

Behind this conventional theory there are several additional beliefs—less explicit, but widespread:

1. The average man is by nature indolent—he works as little as possible.
2. He lacks ambition, dislikes responsibility, prefers to be led.
3. He is inherently self-centered, indifferent to organizational needs.
4. He is by nature resistant to change.
5. He is gullible, not very bright, the ready dupe of the charlatan and the demagogue.

The human side of economic enterprise today is fashioned from propositions and beliefs such as these. Conventional organization

structures and managerial policies, practices, and programs reflect these assumptions.

In accomplishing its task—with these assumptions as guides—management has conceived of a range of possibilities.

At one extreme, management can be “hard” or “strong.” The methods for directing behavior involve coercion and threat (usually disguised), close supervision, tight controls over behavior. At the other extreme, management can be “soft” or “weak.” The methods for directing behavior involve being permissive, satisfying people’s demands, achieving harmony. Then they will be tractable, accept direction.

This range has been fairly completely explored during the past half century, and management has learned some things from the exploration. There are difficulties in the “hard” approach. Force breeds counterforces: restrictions of output, antagonism, militant unionism, subtle but effective sabotage of management objectives. This “hard” approach is especially difficult during times of full employment.

There are also difficulties in the “soft” approach. It leads frequently to the abdication of management—to harmony, perhaps, but to indifferent performance. People take advantage of the soft approach. They continually expect more, but they give less and less.

Currently, the popular theme is “firm but fair.” This is an attempt to gain the advantages of both the hard and the soft approaches. It is reminiscent of Teddy Roosevelt’s “speak softly and carry a big stick.”

IS THE CONVENTIONAL VIEW CORRECT?

The findings which are beginning to emerge from the social sciences challenge this whole set of beliefs about man and human nature and about the task of management. The evidence is far from conclusive, certainly, but it is suggestive. It comes from the laboratory, the clinic, the schoolroom, the home, and even to a limited extent from industry itself.

The social scientist does not deny that human behavior in industrial organization today is approximately what management perceives it to be. He has, in fact, observed it and studied it fairly extensively. But he is pretty sure that this behavior is *not* a consequence of man’s inherent nature. It is a consequence rather of the nature of industrial organizations, of management philosophy, policy, and

practice. The conventional approach of Theory X is based on mistaken notions of what is cause and what is effect.

Perhaps the best way to indicate why the conventional approach of management is inadequate is to consider the subject of motivation.

PHYSIOLOGICAL NEEDS

Man is a wanting animal—as soon as one of his needs is satisfied, another appears in its place. This process is unending. It continues from birth to death.

Man’s needs are organized in a series of levels—a hierarchy of importance. At the lowest level, but preeminent in importance when they are thwarted, are his *physiological needs*. Man lives for bread alone, when there is no bread. Unless the circumstances are unusual, his needs for love, for status, for recognition are inoperative when his stomach has been empty for a while. But when he eats regularly and adequately, hunger ceases to be an important motivation. The same is true of the other physiological needs of man—for rest, exercise, shelter, protection from the elements.

A satisfied need is not a motivator of behavior! This is a fact of profound significance that is regularly ignored in the conventional approach to the management of people. Consider your own need for air: Except as you are deprived of it, it has no appreciable motivating effect upon your behavior.

SAFETY NEEDS

When the physiological needs are reasonably satisfied, needs at the next higher level begin to dominate man’s behavior—to motivate him. These are called *safety needs*. They are needs for protection against danger, threat, deprivation. Some people mistakenly refer to these as needs for security. However, unless man is in a dependent relationship where he fears arbitrary deprivation, he does not demand security. The need is for the “fairest possible break.” When he is confident of this, he is more than willing to take risks. But when he feels threatened or dependent, his greatest need is for guarantees, for protection, for security.

The fact needs little emphasis that, since every industrial employee is in a dependent relationship, safety needs may assume considerable importance. Arbitrary management actions, behavior which arouses uncertainty with respect to continued employment or which reflects favoritism or discrimination,

unpredictable administration of policy—these can be powerful motivators of the safety needs in the employment relationship *at every level*, from worker to vice-president.

SOCIAL NEEDS

When man's physiological needs are satisfied and he is no longer fearful about his physical welfare, his *social needs* become important motivators of his behavior—needs for belonging, for association, for acceptance by his fellows, for giving and receiving friendship and love.

Management knows today of the existence of these needs, but it often assumes quite wrongly that they represent a threat to the organization. Many studies have demonstrated that the tightly knit, cohesive work group may, under proper conditions, be far more effective than an equal number of separate individuals in achieving organizational goals.

Yet management, fearing group hostility to its own objectives, often goes to considerable lengths to control and direct human efforts in ways that are inimical to the natural "groupiness" of human beings. When man's social needs—and perhaps his safety needs, too—are thus thwarted, he behaves in ways which tend to defeat organizational objectives. He becomes resistant, antagonistic, uncooperative. But this behavior is a consequence, not a cause.

EGO NEEDS

Above the social needs—in the sense that they do not become motivators until lower needs are reasonably satisfied—are the needs of greatest significance to management and to man himself. They are the *egoistic needs*, and they are of two kinds:

1. Those needs that relate to one's self-esteem—needs for self-confidence, for independence, for achievement, for competence, for knowledge.
2. Those needs that relate to one's reputation—needs for status, for recognition, for appreciation, for the deserved respect of one's fellows.

Unlike the lower needs, these are rarely satisfied; man seeks indefinitely for more satisfaction of these needs once they have become important to him. But they do not appear in any significant way until physiological, safety, and social needs are all reasonably satisfied.

The typical industrial organization offers few opportunities for the satisfaction of these egoistic needs to people at lower levels in the hierarchy. The conventional methods of organizing work, particularly in mass production industries, give little heed to these aspects of human motivation. If the practices of scientific management were deliberately calculated to thwart these needs, they could hardly accomplish this purpose better than they do.

SELF-FULFILLMENT NEEDS

Finally—a capstone, as it were, on the hierarchy of man's needs—there are what we may call the *needs for self-fulfillment*. These are the needs for realizing one's own potentialities, for continued self-development, for being creative in the broadest sense of that term.

It is clear that the conditions of modern life give only limited opportunity for these relatively weak needs to obtain expression. The deprivation most people experience with respect to other lower level needs diverts their energies into the struggle to satisfy *those* needs, and the needs for self-fulfillment remain dormant.

MANAGEMENT AND MOTIVATION

We recognize readily enough that a man suffering from a severe dietary deficiency is sick. The deprivation of physiological needs has behavioral consequences. The same is true—although less well recognized—of deprivation of higher level needs. The man whose needs for safety, association, independence, or status are thwarted is sick just as surely as the man who has rickets. And his sickness will have behavioral consequences. We will be mistaken if we attribute his resultant passivity, his hostility, his refusal to accept responsibility to his inherent "human nature." These forms of behavior are *symptoms* of illness—of deprivation of his social and egoistic needs.

The man whose lower level needs are satisfied is not motivated to satisfy those needs any longer. For practical purposes they exist no longer. Management often asks, "Why aren't people more productive? We pay good wages, provide good working conditions, have excellent fringe benefits and steady employment. Yet people do not seem to be willing to put forth more than minimum effort."

The fact that management has provided for these physiological and safety needs has

shifted the motivational emphasis to the social and perhaps to the egoistic needs. Unless there are opportunities *at work* to satisfy these higher level needs, people will be deprived; and their behavior will reflect this deprivation. Under such conditions, if management continues to focus its attention on physiological needs, its efforts are bound to be ineffective.

People *will* make insistent demands for more money under these conditions. It becomes more important than ever to buy the material goods and services which can provide limited satisfaction of the thwarted needs. Although money has only limited value in satisfying many higher level needs, it can become the focus of interest if it is the *only* means available.

THE CARROT-AND-STICK APPROACH

The carrot-and-stick theory of motivation (like Newtonian physical theory) works reasonably well under certain circumstances. The *means* for satisfying man's physiological and (within limits) his safety needs can be provided or withheld by management. Employment itself is such a means, and so are wages, working conditions, and benefits. By these means the individual can be controlled so long as he is struggling for subsistence.

But the carrot-and-stick theory does not work at all once man has reached an adequate subsistence level and is motivated primarily by higher needs. Management cannot provide a man with self-respect, or with the respect of his fellows, or with the satisfaction of needs for self-fulfillment. It can create such conditions that he is encouraged and enabled to seek such satisfactions for *himself*, or it can thwart him by failing to create those conditions.

But this creation of conditions is not "control." It is not a good device for directing behavior. And so management finds itself in an odd position. The high standard of living created by our modern technological know-how provides quite adequately for the satisfaction of physiological and safety needs. The only significant exception is where management practices have not created confidence in a "fair break"—and thus where safety needs are thwarted. But by making possible the satisfaction of low level needs, management has deprived itself of the ability to use as motivators the devices on which conventional theory has

taught it to rely—rewards, promises, incentives, or threats and other coercive devices.

The philosophy of management by direction and control—*regardless of whether it is hard or soft*—is inadequate to motivate because the human needs on which this approach relies are today unimportant motivators of behavior. Direction and control are essentially useless in motivating people whose important needs are social and egoistic. Both the hard and the soft approach fail today because they are simply irrelevant to the situation.

People, deprived of opportunities to satisfy at work the needs which are now important to them, behave exactly as we might predict—with indolence, passivity, resistance to change, lack of responsibility, willingness to follow the demagogue, unreasonable demands for economic benefits. It would seem that we are caught in a web of our own weaving.

A NEW THEORY OF MANAGEMENT

For these and many other reasons, we require a different theory of the task of managing people based on more adequate assumptions about human nature and human motivation. I am going to be so bold as to suggest the broad dimensions of such a theory. Call it "Theory Y," if you will.

1. Management is responsible for organizing the elements of productive enterprise—money, materials, equipment, people—in the interest of economic ends.

2. People are *not* by nature passive or resistant to organizational needs. They have become so as a result of experience in organizations.

3. The motivation, the potential for development, the capacity for assuming responsibility, the readiness to direct behavior toward organizational goals are all present in people. Management does not put them there. It is a responsibility of management to make it possible for people to recognize and develop these human characteristics for themselves.

4. The essential task of management is to arrange organizational conditions and methods of operation so that people can achieve their own goals *best* by directing *their own* efforts toward organizational objectives.

This is a process primarily of creating opportunities, releasing potential, removing obstacles, encouraging growth, providing guidance. It is what Peter Drucker has called "management by objectives" in contrast to

"management by control." It does *not* involve the abdication of management, the absence of leadership, the lowering of standards, or the other characteristics usually associated with the "soft" approach under Theory X.

SOME DIFFICULTIES

It is no more possible to create an organization today which will be a full, effective application of this theory than it was to build an atomic power plant in 1945. There are many formidable obstacles to overcome.

The conditions imposed by conventional organization theory and by the approach of scientific management for the past half century have tied men to limited jobs which do not utilize their capabilities, have discouraged the acceptance of responsibility, have encouraged passivity, have eliminated meaning from work. Man's habits, attitudes, expectations—his whole conception of membership in an industrial organization—have been conditioned by his experience under these circumstances.

People today are accustomed to being directed, manipulated, controlled in industrial organizations and to finding satisfaction for their social, egoistic, and self-fulfillment needs away from the job. This is true of much of management as well as of workers. Genuine "industrial citizenship"—to borrow again a term from Drucker—is a remote and unrealistic idea, the meaning of which has not even been considered by most members of industrial organizations.

Another way of saying this is that Theory X places exclusive reliance upon external control of human behavior, while Theory Y relies heavily on self-control and self-direction. It is worth noting that this difference is the difference between treating people as children and treating them as mature adults. After generations of the former, we cannot expect to shift to the latter overnight.

STEPS IN THE RIGHT DIRECTION

Before we are overwhelmed by the obstacles, let us remember that the application of theory is always slow. Progress is usually achieved in small steps. Some innovative ideas which are entirely consistent with Theory Y are today being applied with some success.

Decentralization and Delegation

These are ways of freeing people from the too-close control of conventional organization,

giving them a degree of freedom to direct their own activities, to assume responsibility, and, importantly, to satisfy their egoistic needs. In this connection, the flat organization of Sears, Roebuck and Company provides an interesting example. It forces "management by objectives," since it enlarges the number of people reporting to a manager until he cannot direct and control them in the conventional manner.

Job Enlargement

This concept, pioneered by IBM and Detroit Edison, is quite consistent with Theory Y. It encourages the acceptance of responsibility at the bottom of the organization; it provides opportunities for satisfying social and egoistic needs. In fact, the reorganization of work at the factory level offers one of the more challenging opportunities for innovation consistent with Theory Y.

Participation and Consultative Management

Under proper conditions, participation and consultative management provide encouragement to people to direct their creative energies toward organizational objectives, give them some voice in decisions that affect them, provide significant opportunities for the satisfaction of social and egoistic needs. The Scanlon Plan is the outstanding embodiment of these ideas in practice.

Performance Appraisal

Even a cursory examination of conventional programs of performance appraisal within the ranks of management will reveal how completely consistent they are with Theory X. In fact, most such programs tend to treat the individual as though he were a product under inspection on the assembly line.

A few companies—among them General Mills, Ansul Chemical, and General Electric—have been experimenting with approaches which involve the individual in setting "targets" or objectives *for himself* and in a *self-evaluation* of performance semiannually or annually. Of course, the superior plays an important leadership role in this process—one, in fact, which demands substantially more competence than the conventional approach. The role is, however, considerably more congenial to many managers than the role of "judge" or "inspector" which is usually forced upon them. Above all, the individual is encouraged to take a greater responsibility for

planning and appraising his own contribution to organizational objectives; and the accompanying effects on egoistic and self-fulfillment needs are substantial.

APPLYING THE IDEAS

The not infrequent failure of such ideas as these to work as well as expected is often attributable to the fact that a management has "bought the idea" but applied it within the framework of Theory X and its assumptions.

Delegation is not an effective way of exercising management by control. Participation becomes a farce when it is applied as a sales gimmick or a device for kidding people into thinking they are important. Only the management that has confidence in human capacities and is itself directed toward organizational objectives rather than toward the preservation of personal power can grasp the implications of this emerging theory. Such management will find and apply successfully other innovative ideas as we move slowly toward the full implementation of a theory like Y.

THE HUMAN SIDE OF ENTERPRISE

It is quite possible for us to realize substantial improvements in the effectiveness of industrial organizations during the next decade or two. The social sciences can contribute much to such developments; we are only beginning to grasp the implications of the growing body of knowledge in these fields. But if this conviction is to become a reality instead of a pious hope, we will need to view the process much as we view the process of releasing the energy of the atom for constructive human ends—as a slow, costly, sometimes discouraging approach toward a goal which would seem to many to be quite unrealistic.

The ingenuity and the perseverance of industrial management in the pursuit of economic ends have changed many scientific and technological dreams into commonplace realities. It is now becoming clear that the application of these same talents to the human side of enterprise will not only enhance substantially these materialistic achievements, but will bring us one step closer to "the good society."
